1) `regions`

Represents a geographic region/country used by Google Trends + startup dataset.

- **region_id**: `BIGSERIAL` (PK)
- **region_name**: `VARCHAR(100)` (e.g., "Afghanistan", "Europe")
- **geo_code**: `CHAR(2)` NULL (e.g., "AF")
- **region_level**: `VARCHAR(20)` NULL (e.g., `country`, `continent`, `other`)

2) `domains`

Represents "domain/industry labels" used by Trends and Startups (IoT, FinTech, etc.).

- **domain_id**: `BIGSERIAL` (PK)
- **domain_name**: `VARCHAR(80)` (UNIQUE) (e.g., "IoT", "Gaming", "FinTech")
- **domain_type**: `VARCHAR(30)` NULL (e.g., `startup_industry`, `trends_topic`, `both`)

3) `exit_statuses`

Lookup table for exit status in startup data (Private, Acquired, IPO, etc.).

- **exit_status_id**: `SMALLSERIAL` (PK)
- **status_name**: `VARCHAR(40)` (UNIQUE)

4) `startups`

Core startup entity.

- **startup_id**: `BIGSERIAL` (PK)
- **startup_name**: `VARCHAR(150)` (UNIQUE)
- **domain_id**: `BIGINT` (FK → `domains.domain_id`) *(from Industry)*
- **region_id**: `BIGINT` (FK → `regions.region_id`) *(from Region)*
- **year_founded**: `SMALLINT` *(e.g., 2006)*
- **exit_status_id**: `SMALLINT` NULL (FK → `exit_statuses.exit_status_id`)
- **profitable**: `BOOLEAN`

5) `startup_metrics`

Stores numeric metrics that can change over time, or can be treated as "current snapshot."

- **startup_id**: `BIGINT` (PK, FK → `startups.startup_id`)
- **funding_rounds**: `INTEGER`
- **funding_amount_musd**: `NUMERIC(12,2)`
- **valuation_musd**: `NUMERIC(12,2)`
- **revenue_musd**: `NUMERIC(12,2)`
- **employees**: `INTEGER`
- **market_share_pct**: `NUMERIC(5,2)`

6) `trends_interest_by_region`

From `trends_interest_by_region.csv`.

- **trend_region_id**: `BIGSERIAL` (PK)
- **region_id**: `BIGINT` (FK → `regions.region_id`)
- **domain_id**: `BIGINT` (FK → `domains.domain_id`)
- **domain_interest**: `NUMERIC(6,2)`

7) `trends_interest_over_time`

From `trends_interest_over_time.csv` (time series by domain- one row per date+domain).

- **trend_time_id**: `BIGSERIAL` (PK)
- **trend_date**: `DATE`
- **domain_id**: `BIGINT` (FK → `domains.domain_id`)
- **interest_value**: `NUMERIC(6,2)`

Constraint:

- **UNIQUE(trend_date, domain_id)**
